

GOVERNANCE REPORT

Company name: Trabajo Terminal Defensoria

Date Range: 2026/04/07 - 2026/05/06

Report date: 2026/05/06 01:41

Group by: Business value

TABLE OF CONTENTS

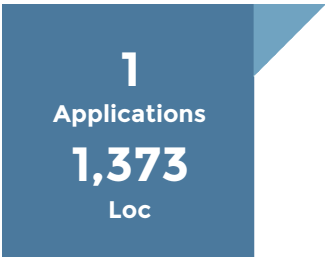

Included
in this
report

- Summary
 - Applications
 - Risk index
 - Security rating
 - Global indicator
- Business quadrant
- Production quadrant
- Development quadrant
- Security quadrant
- Portfolios overview
 - Business value
 - Provider

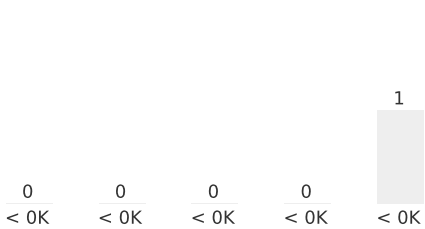

SUMMARY > APPLICATIONS

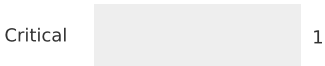

Please note all this report data is grouped by [Business value](#).
The date range is [2026/04/07 - 2026/05/06](#)

Apps By Size

Apps By Business value

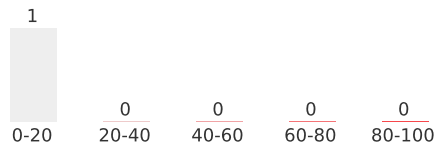

SUMMARY > RISK INDEX

Please note all this report data is grouped by Business value.
The date range is 2026/04/07 - 2026/05/06

Apps By Risk Index

Apps By Business value

Critical	0.51
----------	------

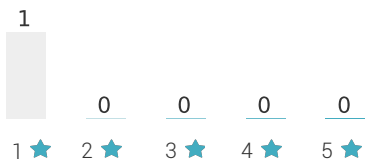

SUMMARY > SECURITY RATING

Please note all this report data is grouped by [Business value](#).
The date range is [2026/04/07 - 2026/05/06](#)

Security rating

Apps By Security Rating

Apps By Business value

Critical ★★★★★

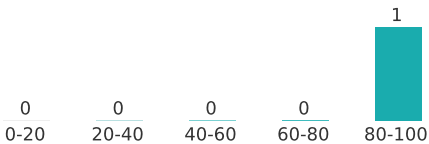

SUMMARY > GLOBAL INDICATOR

Please note all this report data is grouped by [Business value](#).
The date range is [2026/04/07 - 2026/05/06](#)

Apps By Global Indicator

Apps By Business value

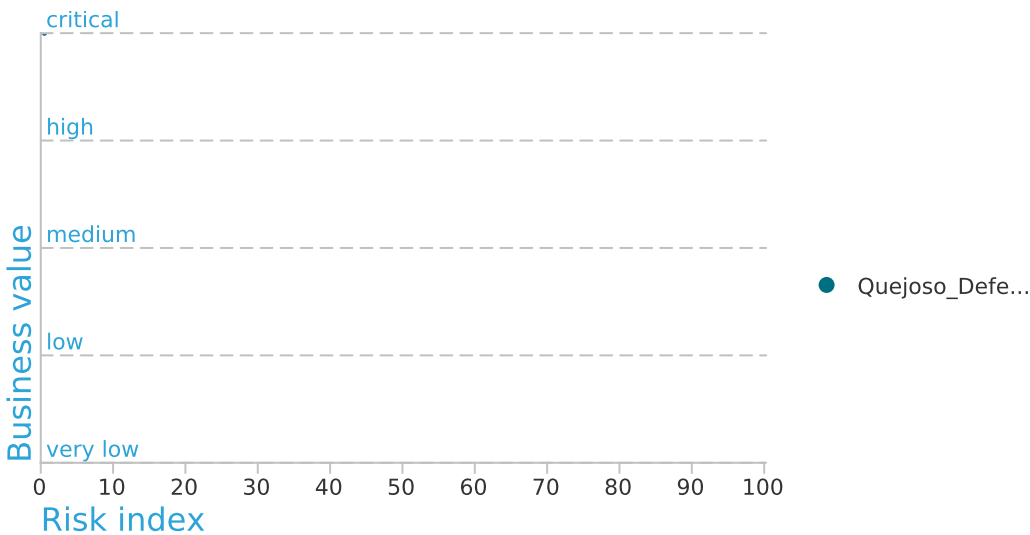

BUSINESS QUADRANT

The business value decision quadrant is aimed to identify those applications in your portfolio that require immediate action based on their criticality for the business and their exposure to any of risks.

Business value. How important is that application for your organization. It is represented in vertical axis.

Risk index. This index combines the application quality, the effort to repair based on the target for each application and the application size. If the risk index is high you should invest in quality (redesign) the application.

Size. The point will be as bigger as applications is, measured in kilo lines of code.

Application	Business	Risk	Indicator	Size(k)
Quejoso_Defensoria	critical	0.51	90.54	1.37

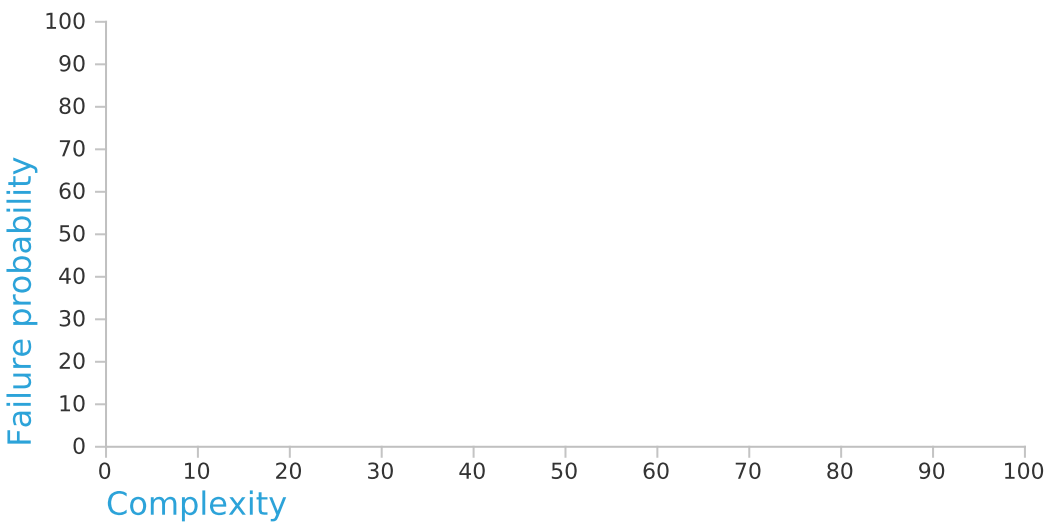

PRODUCTION QUADRANT

The **production quadrant** is aimed to identify those applications in your portfolio that could cause problems in production, and if they will be able to recover from these errors easily. The applications with higher exposure to this kind of risk will be those in the upper-right area of the quadrant.

Failure probability. This indicates if applications are likely to provoke errors in production. Applications with high failure probability could be a problem in the short term.

Complexity. a normalized (between 0 and 100) metric based on applications' cyclomatic complexity by function, duplication of code and maintainability index.

Application	Failure probability	Complexity	Size(k)
Quejoso_Defensoria	0	0	1.37

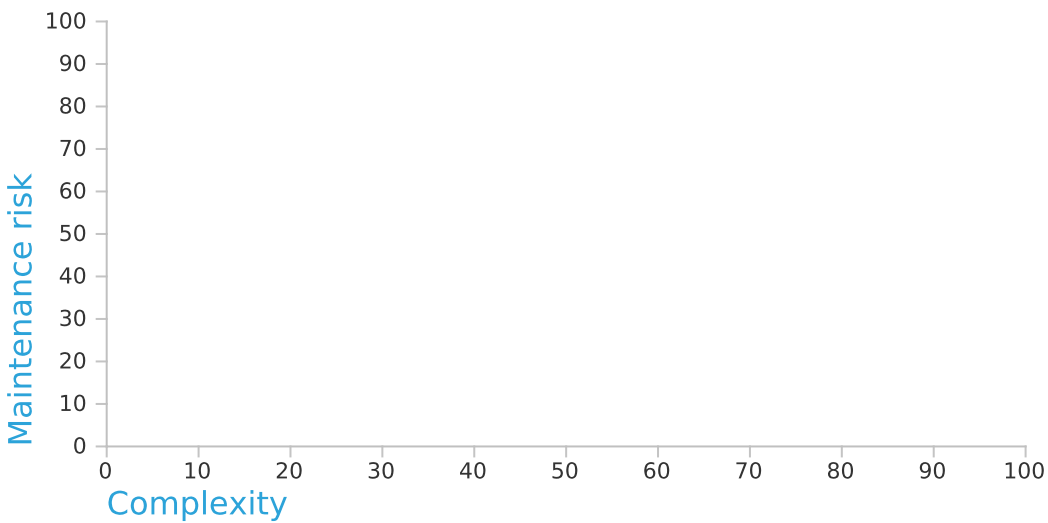

DEVELOPMENT QUADRANT

The **development quadrant** is aimed to identify those applications in the midterm given the difficulty and associated cost to maintain them. The applications with higher exposure to this risk will be those in the upper-right area of the quadrant.

Maintenance Risk. This indicates if applications' maintenance costs are going to be higher than expected, or if it is going to be costly to add new functionality to them. It is based on the evidence gathered from the code for the maintainability index.

Complexity. a normalized (between 0 and 100) metric based on applications' cyclomatic complexity by function, duplication of code and maintainability index.

Application	Maintenance risk	Complexity	Size(k)
Quejoso_Defensoria	0	0	1.37

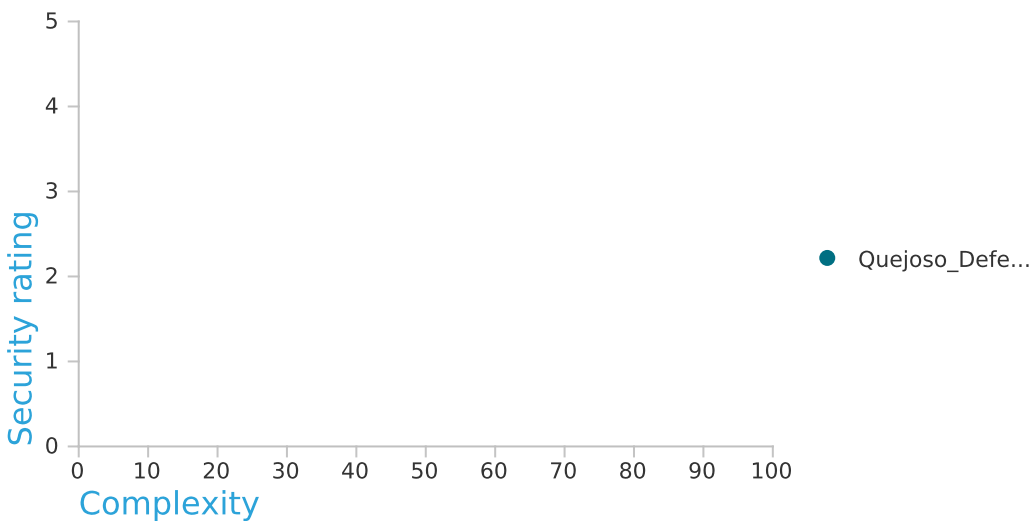

SECURITY QUADRANT

The **Security quadrant** is aimed to identify those applications that are exposed to potential attacks, that can compromise the integrity of you organization. The applications with higher exposure to this risk will be those in the lower-right area of the quadrant.

Security Rating. This indicated how vulnerable an application is to internal or external attacks based on the number of vulnerabilities found in the application's code as listed by CWE and OWASP.

Complexity. a normalized (between 0 and 100) metric based on applications' cyclomatic complexity by function, duplication of code and maintainability index.

Application	Security risk	Complexity	Size(k)
Quejoso_Defensoria	★☆☆☆☆	0	1.37

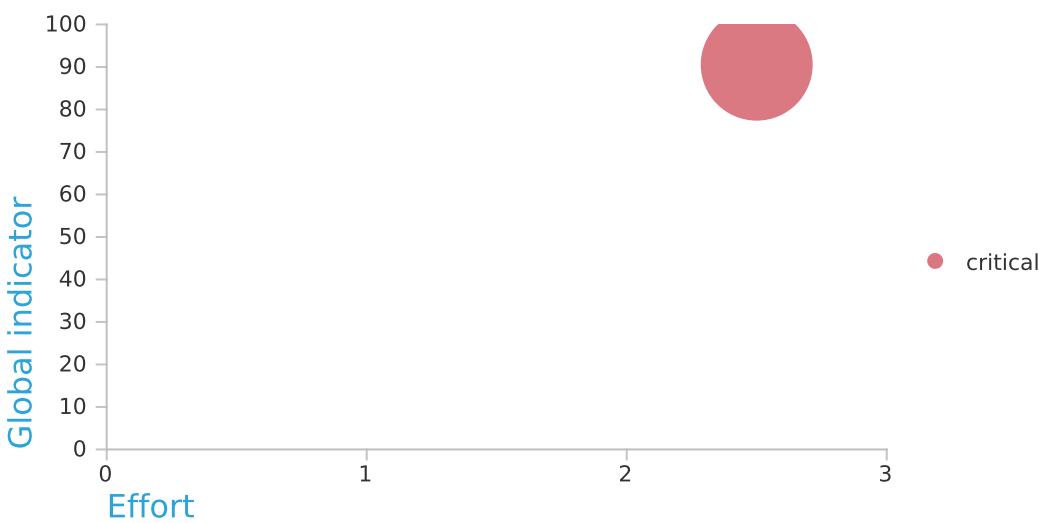

PORTFOLIOS OVERVIEW > BUSINESS VALUE

You have your applications grouped by portfolios (up to 8 portfolios). Each bubble represents one application group. The chart shows three different metrics:

Global indicator. How important is that group of applications for your organization. It is represented in vertical axis.

Effort. How much it will cost to reach your goal, in hours.

Size. The point will be as bigger as the group of applications is, measured in kilo lines of code.

Business value	# apps	Effort	Indicator	Size(k)
critical	1	2	90.54	1.37

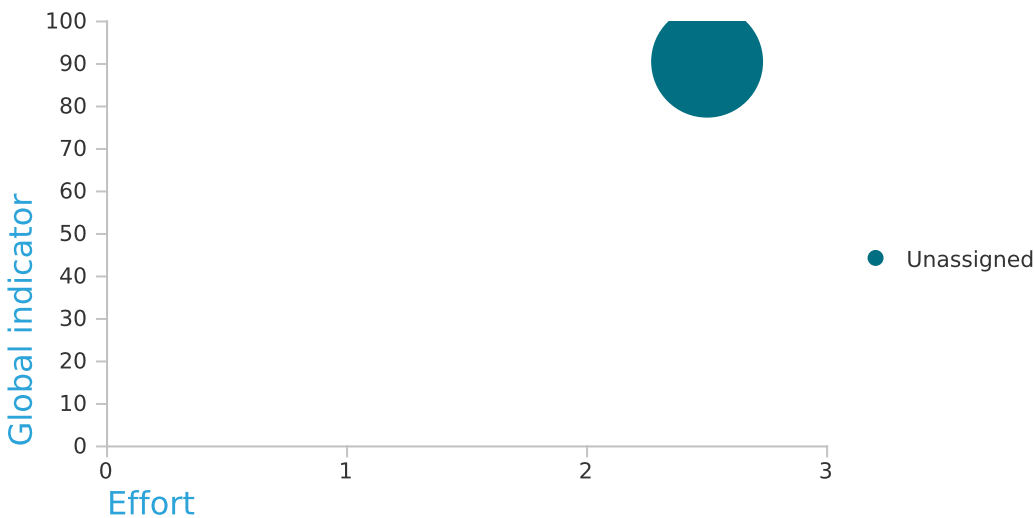

PORTFOLIOS OVERVIEW > PROVIDER

You have your applications grouped by portfolios (up to 8 portfolios). Each bubble represents one application group. The chart shows three different metrics:

Global indicator. How important is that group of applications for your organization. It is represented in vertical axis.

Effort. How much it will cost to reach your goal, in hours.

Size. The point will be as bigger as the group of applications is, measured in kilo lines of code.

Provider	# apps	Effort	Indicator	Size(k)
Unassigned	1	2	90.54	1.37
